How to find last installed apps on android. How to find most recently installed apps on android. How to find install unknown apps on android. Search installed apps on android phone.

1 Install AirDroid on your Android. AirDroid is a free app that lets you access your Android's home screen from your computer. This means you can update Android apps through the Play Store just as you would if you were using the phone's touch screen. The app is free from the Play Store, although some features (not the one you need right now) require a premium subscription. The app has a green icon with a white paper airplane inside, and the developer is Sand Studio. You will need to connect your Android to your PC or Mac with a USB cable to use this method. 2 Enable USB Debugging on your Android phone or tablet. You'll only need to do this once. This allows you to connect your Android to your computer via USB: Open Settings and tap About phone or About tablet.[1] Tap Software information. Tap Build number 7 times (quickly) until you see the message that says "Developer mode is enabled." Return to the Settings main screen and tap Developer options. If the switch is not enabled, tap it to enable it now. Slide the "USB debugging" switch to the On position. Tap About phone or About tablet. 3 Create an AirDroid account. To do so: Go to in a web browser. Enter your email address and create a password. Type a nickname for your account. Click Next to send a confirmation code to yourself via email. Copy the confirmation code in the email from AirDroid and paste it into the "Enter verification code here" field. Click Verify and sign up. 4 Install AirDroid for Windows or macOS. Now that you have an account, scroll down and click the Download link below your operating system to download the AirDroid installer. Once downloaded, double-click the installer to run, and then follow the on-screen instructions to complete the installation. If you're using Google Chrome as your web browser and prefer to use a web-based version of AirDroid, you can click Start under "AirDroid Web" instead to install the Chrome AirDroid extension. Once installed, you can access AirDroid on the web at . The remaining steps will be a little different for the web version, but not too different. 5 Log in to AirDroid on your Android. Downloading the app earlier added a new green-and-white paper airplane icon to your app drawer. Tap it to launch AirDroid, and then enter your login information to sign in. 6 Enable Remote Control on your Android. The first time you set up AirDroid, you'll be prompted to set up Security & Remote Features. Here's how to enable Remote Control: Tap OK to set up Security & Remote Features. Tap Remote Control near the bottom of the list. Tap the green Enable Permissions button at the bottom of the screen. *Tap OK on the pop-up message to close it. In the future, you can enable and disable this feature in AirDroid by tapping the Me tab and navigating to Security & Remote Features > Remote Control. 7 Log in to AirDroid on your PC or Mac. To do this, open the new AirDroid app in the Start menu (PC) or in the Applications folder, and then enter your login credentials. Once you're signed in, you'll see your Android listed under "My devices." If you don't see your Android in the list, make sure it's connected to the same Wi-Fi network as your computer, and that the app is open.[2] 8 Start a Remote Control session. You'll need to do this every time you want to start a new remote control session. Here's how you'll do it: On the PC or Mac version of AirDroid, click the binoculars icon in the left column. This opens the Remote Control panel. [3] Click Start Non-Root authority on the computer. Connect your Android to the computer with your USB charging cable. Plug the larger USB end into an available USB port on your computer. In a moment, you should see a pop-up message on your Android. Tap Ok on the Android to enter debugging mode. If prompted to select a USB configuration on your Android, select Charging only. Follow the on-screen instructions on your Android to start the remote connection. Once you approve the connection, you will see your Android's home screen in the AirDroid window on your computer. If the remote session doesn't start automatically, click the binoculars icon again, and then click Connect under your Android. 9 Use your computer to open the Play Store app on your Android. Using your mouse in the same way you'd tap with your finger, click the Play Store icon, which looks like a sideways multicolored triangle. It'll be in your app drawer. 10 Click the menu ☰. It's at the top-left corner of the Play Store. A menu will expand. 11 Click My apps & games on the menu. It's the first menu option. This displays a list of apps on your Android that have updates available. 12 Tap Update all to update all apps at once. It's the green button near the top-right corner of the list. If you prefer, you can just tap Update next to an individual app to update it instead. When you are finished updating your apps, you can close the connection by closing the AirDroid window on your computer, and/or by closing the AirDroid app on your Android. In the future, just open AirDroid on both your Android and your computer, connect the two via USB, and click the binoculars to start a new connection. Advertisement The easiest way is to use the Your Phone App from Microsoft.However, this method actually runs the app from your phone and displays it on Windows rather than emulating Android on Windows. If you want to ensure your files and data are easily accessible across devices, one way is to run the same apps on your PC as you do on your Android phone. Microsoft's operating system has become increasingly Android-friendly, and we'll show you how to use this to run apps from your Android device on your Windows 10 PC. There are two main ways to run Android apps on a Windows 10 machine. You can use an Android emulator. This is an application which simulates an entire Android device (including both hardware and software), so the Android app will behave as if it's on an Android device. Emulators allow you to install the app locally, so it's always available, but they borrow a good amount of horsepower from your PC. If you feel like this is the approach for you, use the Bluestacks emulator to run Android apps on your PC. The other option is to run the app from your phone, but display and interact with it through your PC. This has the advantage of not requiring complicated emulators, but it also requires your phone be linked to your PC while you're using your PC. You can check out the emulation solution with the link above. These instructions require the following: A Windows PC with at least the Windows 10 May 2020 Update installed.An device running version 11.0 (or higher) of Android.In addition, Microsoft recommends having at least 8 GB of RAM. To run Android apps from your phone on Windows, take the following steps: First, get the Your Phone app from Microsoft to install on your Windows 10 PC. Make sure the version you get is at least 1.20104.15.0. Next, go to the Google Play store to get the Your Phone Companion app If you already have it installed, make sure it's updated, as you'll need at least version 1.20104.15.0 to access your apps. You'll need to link your Android device to your PC. Make sure they're on the same network, then open the Your Phone app on the PC. Click on the Get Started button. Check the I have the companion app ready option if you installed the "My Phone" app as described in step 2. Otherwise the URL on this screen will take you straight to it. Once it's installed, you can easily pair your phone by clicking the Pair with QR Code button Then, open the Link to Windows option in Android Settings, which will display a screen to confirm you are in fact seeing the QR Code. Tap Continue. Finally, point your phone at the QR Code. Once the camera picks it up, the Windows app will show a screen explaining the permissions it requires. On the phone, you can tap Allow to give Windows the permissions it needs as they come up. When you're finished tap Continue, and the two devices are linked. On the PC you'll get a welcome screen showing your phone and PC are now linked; on the Android device, you may see an additional permission as shown in the below screenshot.

to accept this now, and it will also appear once each time you connect your devices. Click Start recording or casting with Your Phone Companion, which is what allows your phone to transmit its app (or entire screen) to the PC. Select the Apps option in the left-hand panel. This will display a list of apps installed on your phone. Click on the app you want, and it will launch in a window just as it looks on your device. Alternately, you can use the Open Phone Screen link to open a window which mimics your device, home screen and all. You can open and interact with apps in this way as well. When opening apps in step 13, they will open within the "phone's" window. However, when launching from the Apps screen in the Windows Your Phone app, they open in separate windows. This means you can multi-task by having multiple Android app windows open at once. You can also pin these apps to the Taskbar, just like any normal Windows app. FAQ How do I connect my Android to my Windows PC? Connect your phone and PC with a USB cable and select Transfer files on your Android. On your PC, select Open device to view files > This PC. Alternatively, connect wirelessly via Bluetooth. What is the best Android emulator? Can I run Windows on Android? Can I use Android apps on Windows 11? Thanks for letting us know! Get the Latest Tech News Delivered Every Day Subscribe Tell us why!
